problem, Autoloaded options could affect performance, by Mbsmgroup

Category: Machine Learning

written by Mbsm.tn | 30 March 2025

The screenshot displays the WordPress Site Health dashboard. At the top, the title 'Site Health' is centered, followed by a yellow circle icon and the text 'Should be improved'. Below this, there are two tabs: 'Status' (which is active and underlined) and 'Info'. The main content area is titled 'Site Health Status' and contains the following text: 'The site health check shows information about your WordPress configuration and items that may need your attention.' Below this, it states '1 critical issue' and explains that 'Critical issues are items that may have a high impact on your sites performance or security, and resolving these issues should be prioritized.' A specific issue is highlighted in a box with a red underline: 'Autoloaded options could affect performance'. To the right of this title is a 'Performance' button with an upward arrow. The description of the issue reads: 'Autoloaded options are configuration settings for plugins and themes that are automatically loaded with every page load in WordPress. Having too many autoloaded options can slow down your site. Your site has 1055 autoloaded options (size: 982 KB) in the options table, which could cause your site to be slow. You can review the options being autoloaded in your database and remove any options that are no longer needed by your site.' A link for 'More info about optimizing autoloaded options' is provided at the bottom of the issue box.
