Introduction to the Plugin

The **Media Control** plugin provides users with complete control over displaying various types of media, such as images, videos, audio files, PDFs, and ZIP files on their WordPress sites. The plugin is designed to be highly flexible, allowing customization of settings for displaying different media types, while offering pagination to manage a large number of files efficiently.

Key Features of the Plugin

1. **Advanced Media Filtering:** Users can filter the types of media they wish to display on their site. For example, they can choose to display only images or combine video and audio files in the same gallery.
2. **Integrated Pagination:** The plugin makes it easy for visitors to navigate through a large number of files by dividing the content into pages, helping improve website load time and enhancing the user experience.
3. **Attractive Media Display:** The plugin supports an organized and visually appealing display of media files that blends well with the overall design of the site. Media files like images, videos, and audios are displayed neatly with customizable templates.
4. **Security and Filtering:** A strong focus on security is evident in the plugin's design. It automatically filters out file types that may pose security risks, such as **PHP**, **CSS**, and **JS**, ensuring the site remains safe from vulnerabilities.

The plugin is built using PHP and MySQL, ensuring fast and efficient performance even on websites with a large number of media files. The media files are loaded progressively (Lazy Load) with pagination support, minimizing memory consumption and improving page load speeds.

Shortcode for Displaying Media

Shortcodes make it easy to insert media galleries anywhere on your WordPress site—whether in posts, pages, or widgets. You can define exactly what types of media you want to display and control how they appear on your site.

Shortcode Example:

```
[media_gallery media_type="image, video" media_count="10"]
```

Parameters Explained:

1. **media_type:**

- This parameter allows you to specify which types of media you want to display. You can specify multiple types by separating them with commas. For example, use "image, video" to display both images and videos.
- Supported media types include: image, audio, video, pdf, zip.

2. **media_count:**

- This parameter determines how many media files will be displayed per page. You can set a custom number to limit the number of files shown, optimizing your site's load time and usability.

How to Use the Shortcode:

- You can place this shortcode in any page, post, or widget to display a media gallery with the selected file types and pagination.
- For example, if you want to display 10 images and videos on a page, add the following shortcode to your page content:

```
[media_gallery media_type="image, video" media_count="10"]
```

Once the shortcode is added, the plugin will display the media files according to the parameters you've defined.
